

AMENDMENTS TO THE CLAIMS

AI 1. (Currently amended) A service providing system for verifying a source of information comprising:

- (a) a computer network;
- (b) at least one server connected to the computer network and sending information including ~~a specified mark~~ a tag to the computer network;
- (c) a communication carrier connected to the computer network and adding specified data to the information; when the information received from the computer network includes the ~~specified mark tag~~, ~~specified data to the information~~, the specified data identifying a the server which has sent the information; and
- (d) a mobile device provided with a display having a proprietary display area for displaying the specified data when the specified data is added to the information, wherein the specified data which can not cannot be edited by an unauthorized person, making wireless communication with the communication carrier ~~and displaying the specified data on the proprietary display area when receiving information includes the specified data.~~

2. (Currently amended) The service providing system ~~as claimed in~~ of claim 1, wherein the communication carrier ~~comprising~~ comprises:

- (i) a database for storing the specified data to identify the server in correspondence with ~~a unique address~~ an address information of the server on the computer network;
- (ii) ~~a detection portion~~ detector for detecting ~~the specified mark~~ the tag;
- (iii) an acquisition portion for acquiring the specified data to identify the ~~information sending~~ server by referring to the address ~~of the information sending~~ of the server when the ~~specified mark tag~~ is detected; and
- (iv) an addition portion for adding the specified data ~~as acquired~~ to the information as received when the address information of the server is matched with an address information that corresponds to the specified data stored in the communication carrier.

A1 3. (Currently amended) A service providing system for verifying a source of information comprising:

(a) a computer network;
(b) at least one server connected to the computer network and sending information including ~~a specified mark~~ a tag to the computer network;

(c) a communication carrier connected to the computer network and receiving the information including the tag from the computer network; and

(d) a mobile device provided with a display having a proprietary display area which can not be edited by an unauthorized person, making wireless communication with the communication carrier, ~~acquiring the specified data which identifies the server which has send the information and displaying the specified data on the proprietary display area when the information as received from the communication carrier includes the specified data wherein the mobile device detects the tag and adds specified data to the information when the information received from the computer network includes the tag, wherein the specified data is obtained from a database accessible from the computer network, and wherein the proprietary display area is for displaying the specified data and the specified data in the proprietary area cannot be edited by an unauthorized person.~~

4. (Currently amended) The service providing system ~~as claimed in~~ of claim 1 3 wherein ~~the computer network is connected to a database for storing the specified data to identify the server in correspondence with a unique address of the server on the computer network, and~~

wherein the mobile device ~~comprising~~ comprises:

(i) ~~a detection portion~~ detector for detecting the ~~specified mark~~ tag; and
(ii) an acquisition portion for acquiring the specified data from the database to identify the ~~information sending~~ server by referring to the address information of the server of the ~~information sending server~~ when the ~~specified mark~~ tag is detected.

A1
5. (Currently amended) A service providing method for verifying a source of information, the method comprising:

(a) receiving information including a ~~specified-mark~~ tag from a server connected to a communication carrier via a computer network;

(b) detecting the tag ~~specified-mark~~ from the information ~~as received~~;

(c) acquiring a specified data stored in the communication carrier ~~for~~ and identifying the server when the tag ~~specified-mark~~ is detected;

(d) adding the specified data to the information when an address information of the server is matched with an address information that corresponds to the specified data stored in the communication carrier;

(e) receiving the information including the specified data by means of a mobile device of a user; and

(f) displaying the specified data on the mobile device under a condition that the specified data ~~can not~~ cannot be edited by an unauthorized person.

6. (Currently amended) A service providing method for verifying a source of information, the method comprising:

(a) receiving information including a ~~specified-mark~~ tag from a server connected to a computer network by means of a mobile device of a user;

(b) detecting the ~~specified-mark~~ tag from the information ~~as received~~;

(c) acquiring a specified data stored in a database accessible from the computer network ~~for~~ and identifying the server, when the mobile device detects the tag and an address information of the server is matched with an address information that corresponds to the specified data ~~specified-mark is detected, through the mobile device; and~~

(d) displaying the specified data to the user through a display of the mobile device under a condition that the specified data ~~can not~~ cannot be edited by an unauthorized person.

A/ 7. (Currently amended) A mobile device used in a service providing system for verifying a source of information, the mobile device comprising:

(a) a receiver portion for receiving information including a ~~specified-mark~~ tag from a server connected to a computer network through wireless communication;

(b) a ~~detection-portion~~ detector for detecting the ~~specified-mark~~ tag from the information as ~~received~~;

(c) an acquisition portion for acquiring a specified data for identifying the server when the ~~specified-mark~~ tag is detected and an address information of the server is matched with an address information that corresponds to the specified data;

(d) a proprietary display area for displaying the specified data under a condition that the specified data ~~can not~~ cannot be edited by an unauthorized person.

8. (Cancelled)
